Glanville fritillary butterfly

Metapopulation dynamics

Habitat loss and extinction thresholds

Levins' model:

$$\frac{dp}{dt} = \underbrace{cp(1 - D - p)}_{\text{colonisations}} - \underbrace{ep}_{\text{extinctions}}$$

fraction of occupied patches

fraction of destroyed patches

colonisation rate

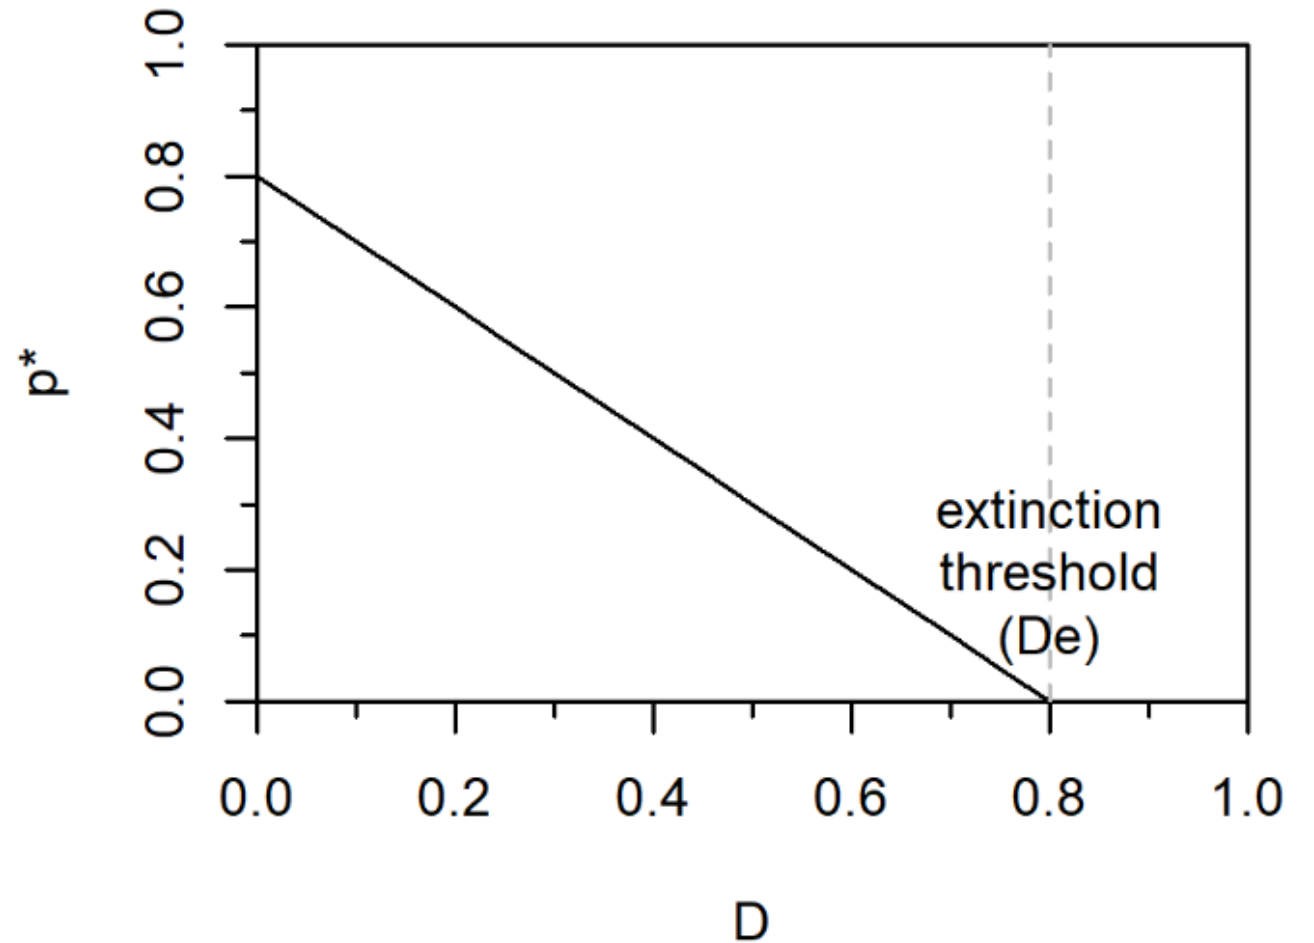

extinction rate

time

Habitat loss and extinction thresholds

$$p^* = \begin{cases} 1 - D - e/c & \text{if } D < D_e \\ 0 & \text{if } D \geq D_e \end{cases}$$

$$D_e = 1 - e/c$$

EXTINCTION THRESHOLDS IN DEMOGRAPHIC MODELS OF TERRITORIAL POPULATIONS

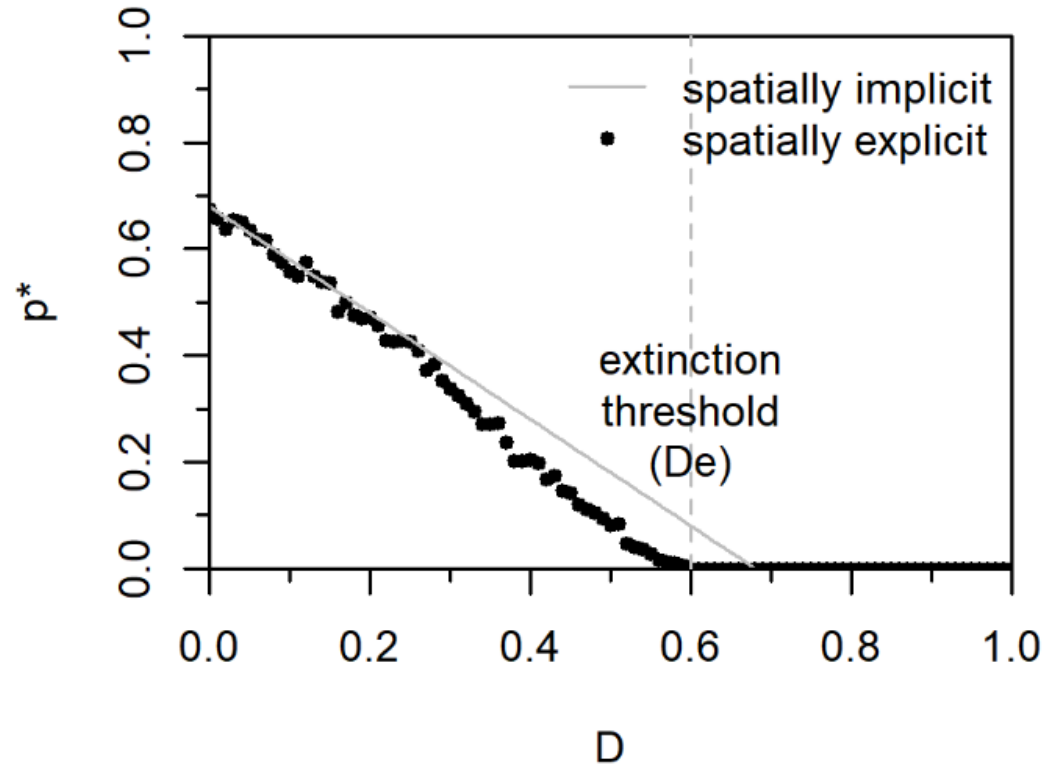

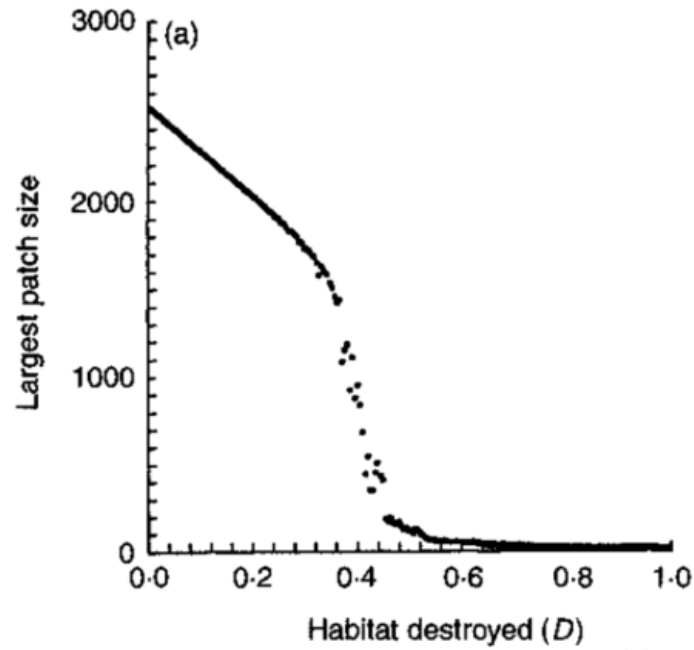

RUSSELL LANDE

Northern spotted owl

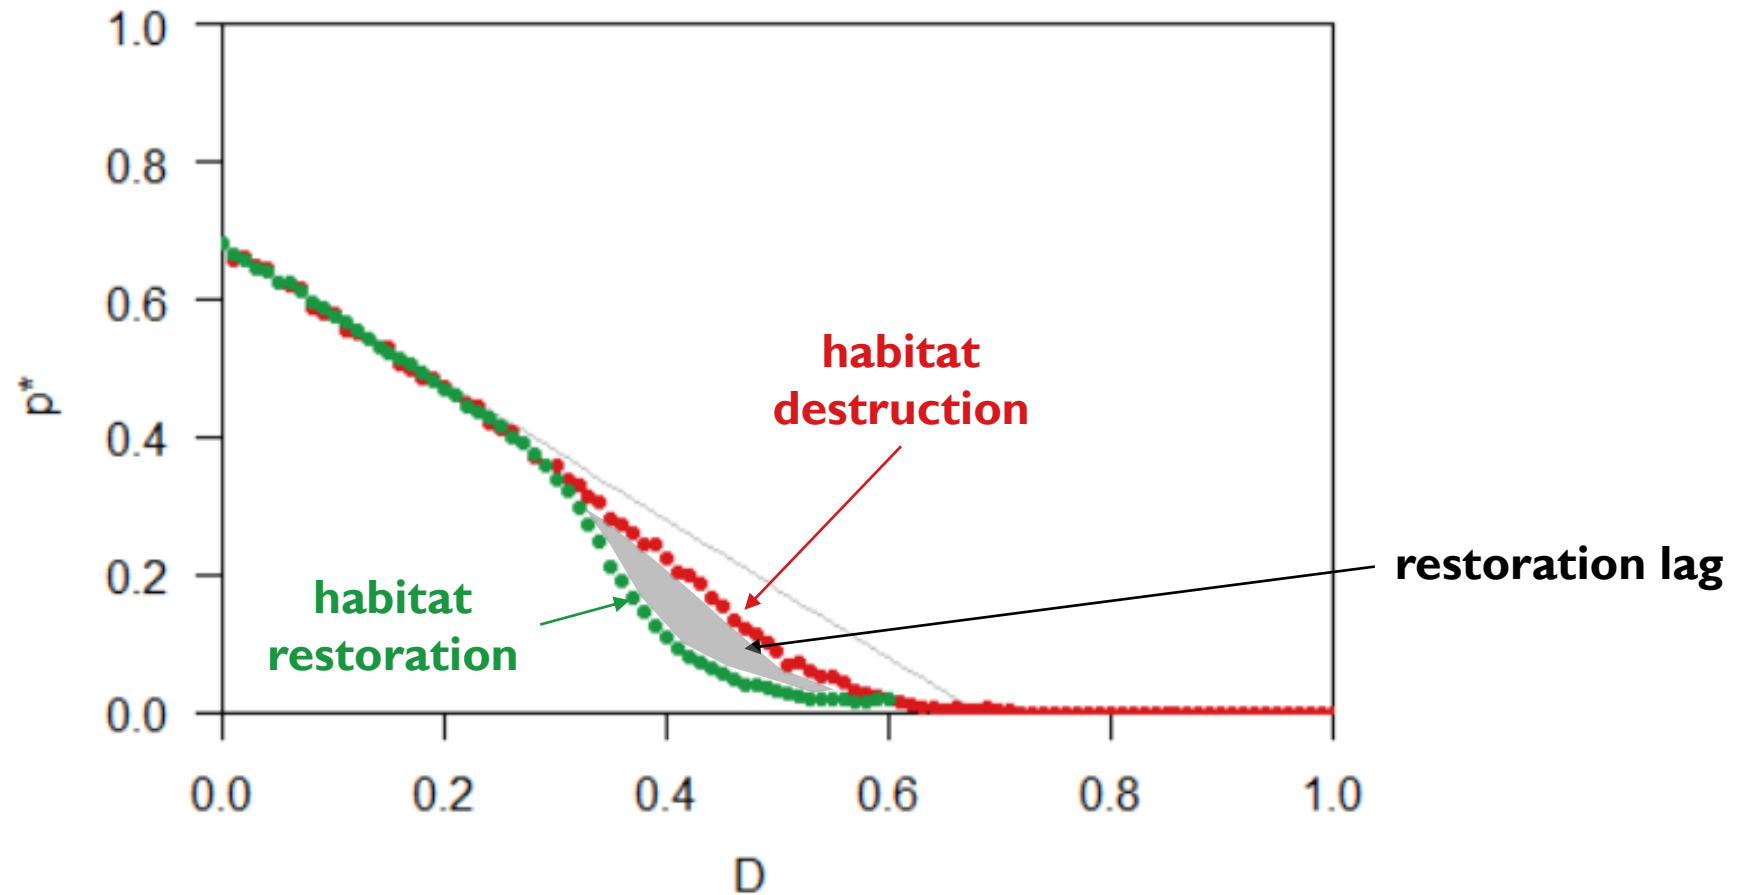

Habitat fragmentation and extinction thresholds in spatially explicit models

JORDI BASCOMPTE*‡ and RICARD V. SOLÉ†

Habitat restoration in spatially explicit metacommunity models

Klementyna A. Gawecka  | Jordi Bascompte 

Spatial networks

path

sequence of nodes such that nodes are visited only once

spanning tree

path that includes every node only once

minimum spanning tree

spanning tree with the shortest length

connected graph

graph where a path between each pair of nodes exists

Spatial networks

I. Identifying nodes

Spatial networks

2. Connecting nodes

- Nearest neighbours
- Minimum spanning tree
- Connected graph
- ...

- Threshold distance
- Dispersal probabilities
- Least-cost paths
- ...

Spatial networks

2. Connecting nodes

- Nearest neighbours
- Minimum spanning tree

- Least-cost paths
- ...

minimum spanning tree

area-weighted dispersal probabilities

LANDSCAPE CONNECTIVITY: A GRAPH-THEORETIC PERSPECTIVE

DEAN URBAN^{1,3} AND TIMOTHY KEITT^{2,4}

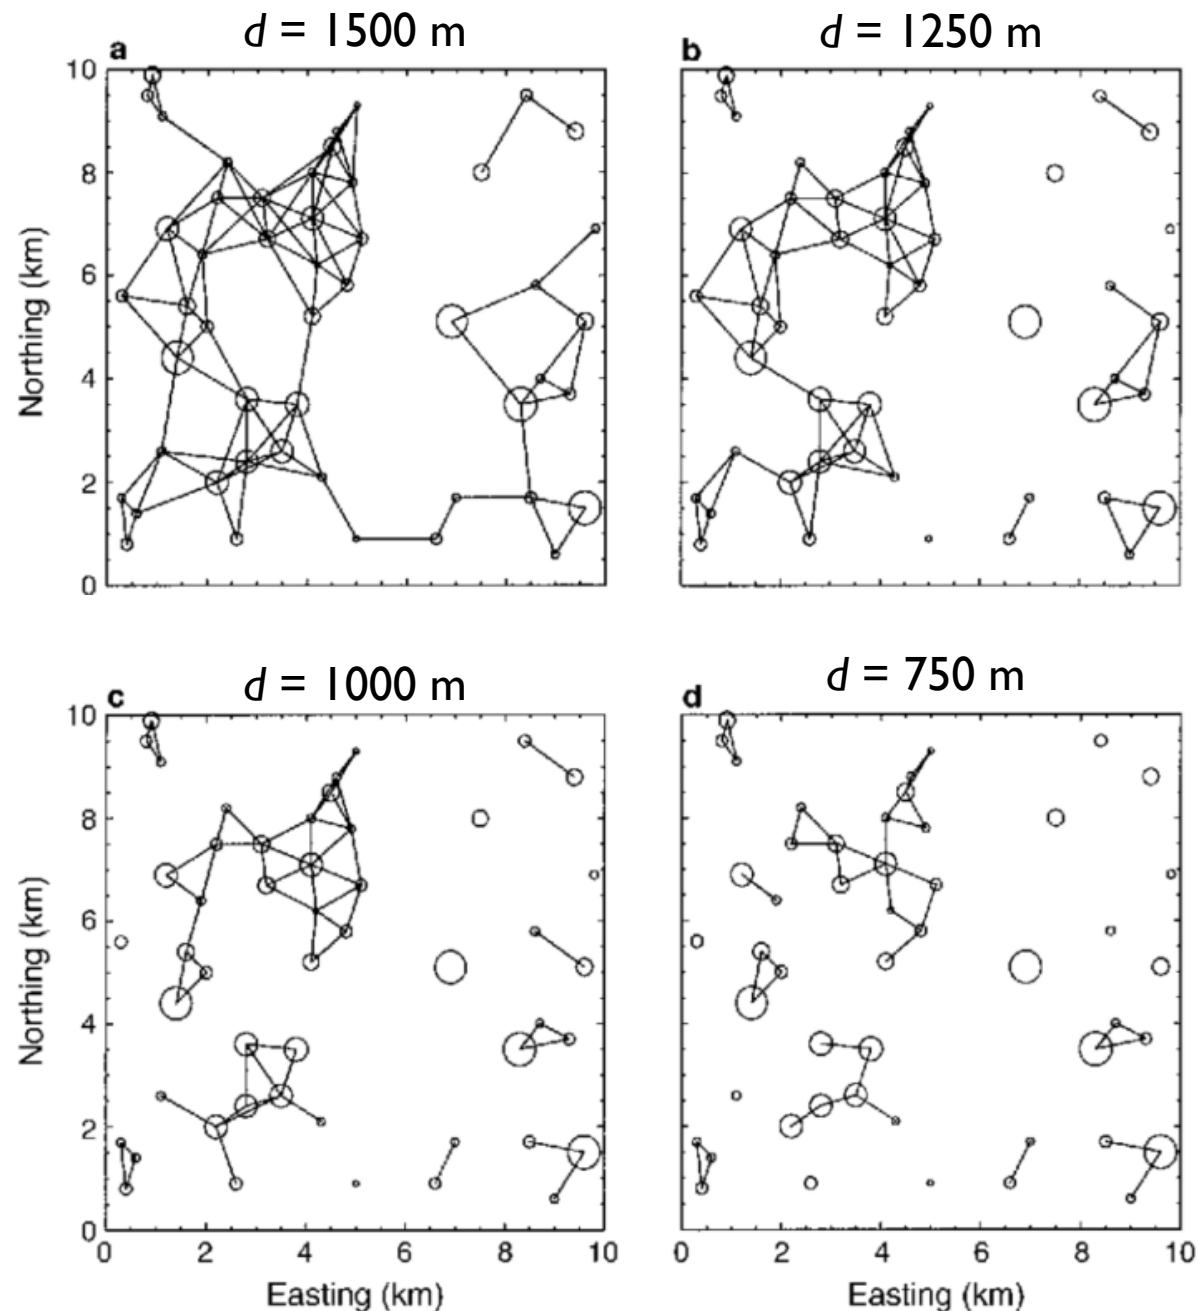

link removal

Is there a systematic relationship between the connectivity of a graph and the number of links removed?

How should corridors be preserved to maintain overall connectivity of the habitat mosaic?

At what threshold distance (d) does the graph become unconnected?

How does this distance compare to dispersal capabilities of species of concern?

LANDSCAPE CONNECTIVITY: A GRAPH-THEORETIC PERSPECTIVE

DEAN URBAN^{1,3} AND TIMOTHY KEITT^{2,4}

node removal

Which nodes are most important for preserving the graph's structure?

Which habitat patches have most influence on metapopulation processes within the landscape?

Which patches should be prioritised for monitoring / protection / restoration?

4 most important patches for:

recruitment potential

dispersal flux

traversability
