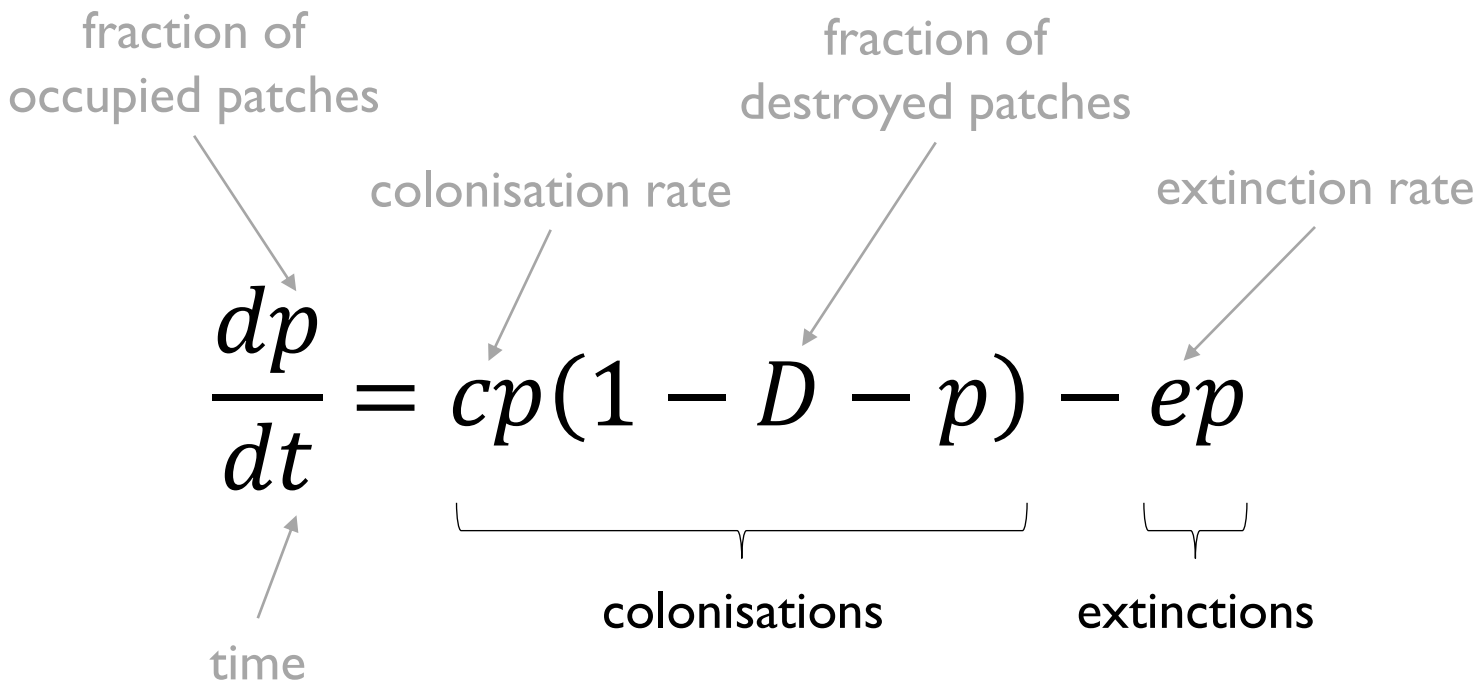
Habitat loss and extinction thresholds

Levins' model:



Habitat loss and extinction thresholds

$$p^* = \begin{cases} 1 - D - {}^{e}/_{c} & if\ D < D_e \\ 0 & if\ D \geq D_e \end{cases}$$

$$D_e = 1 - {}^{e}/_{c}$$

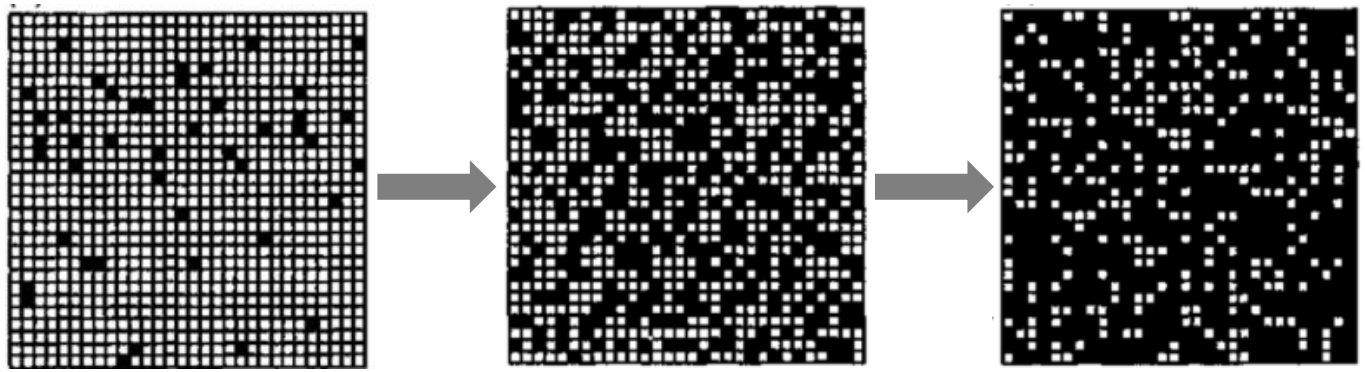
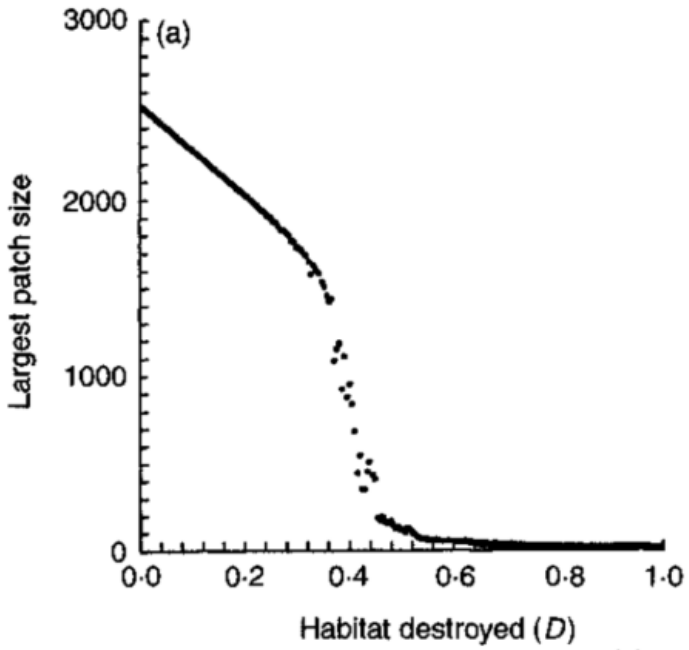
Northern spotted owl

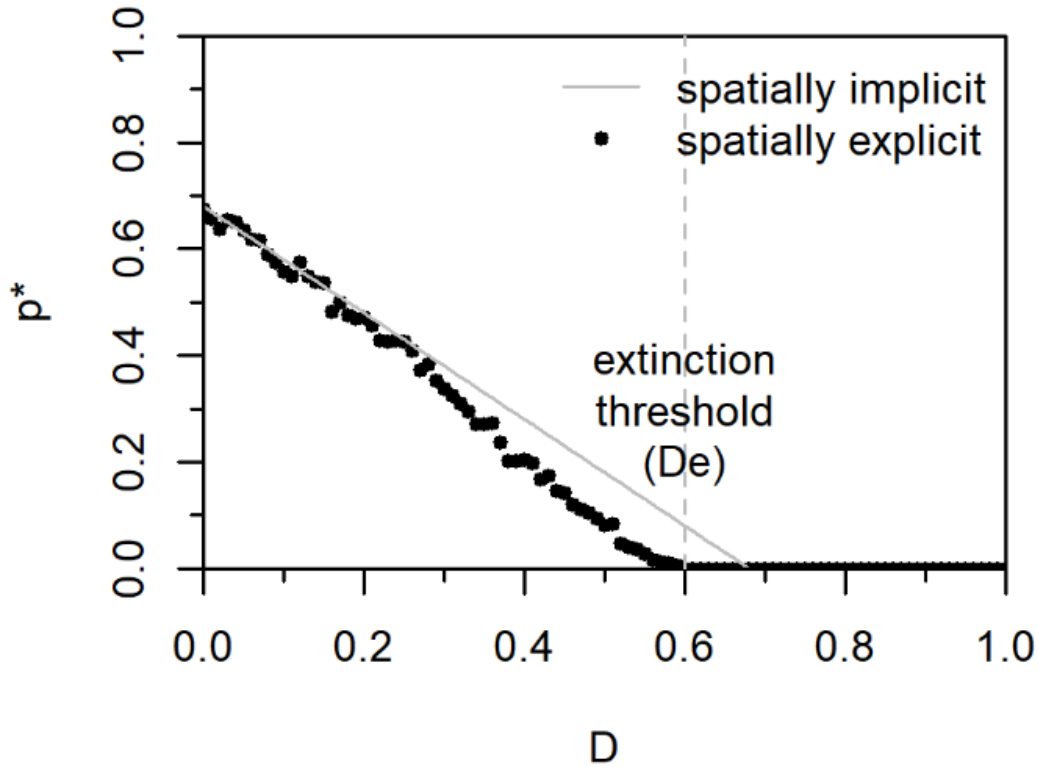
Journal of Animal Ecology 1996, **65**, 465–473

Habitat fragmentation and extinction thresholds in spatially explicit models

JORDI BASCOMPTE*‡ and RICARD V. SOLÉ†







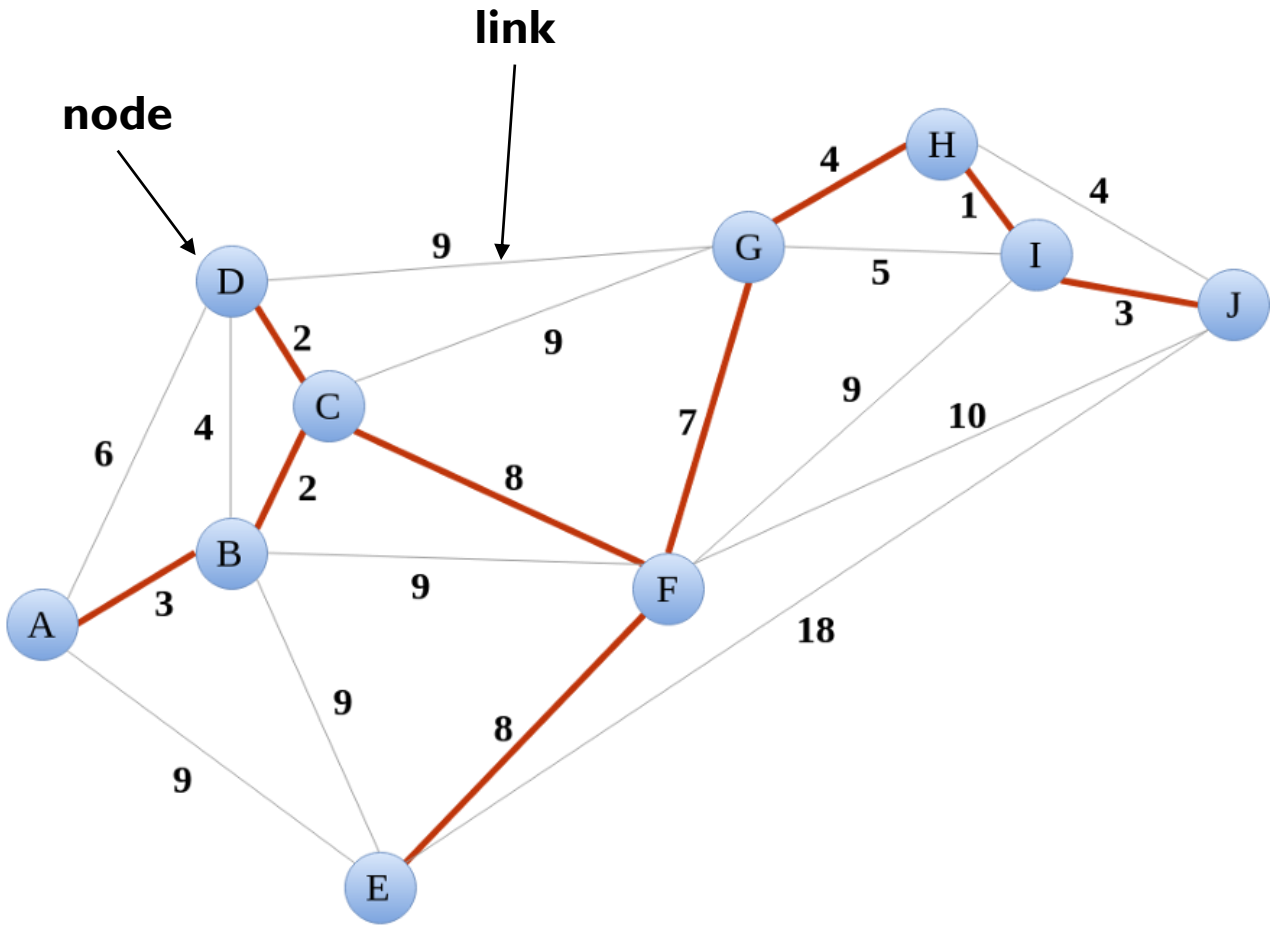
Spatial networks

path
sequence of nodes such that nodes are visited only once

spanning tree
path that includes every node only once

minimum spanning tree
spanning tree with the shortest length

connected graph
graph where a path between each pair of nodes exists



Spatial networks

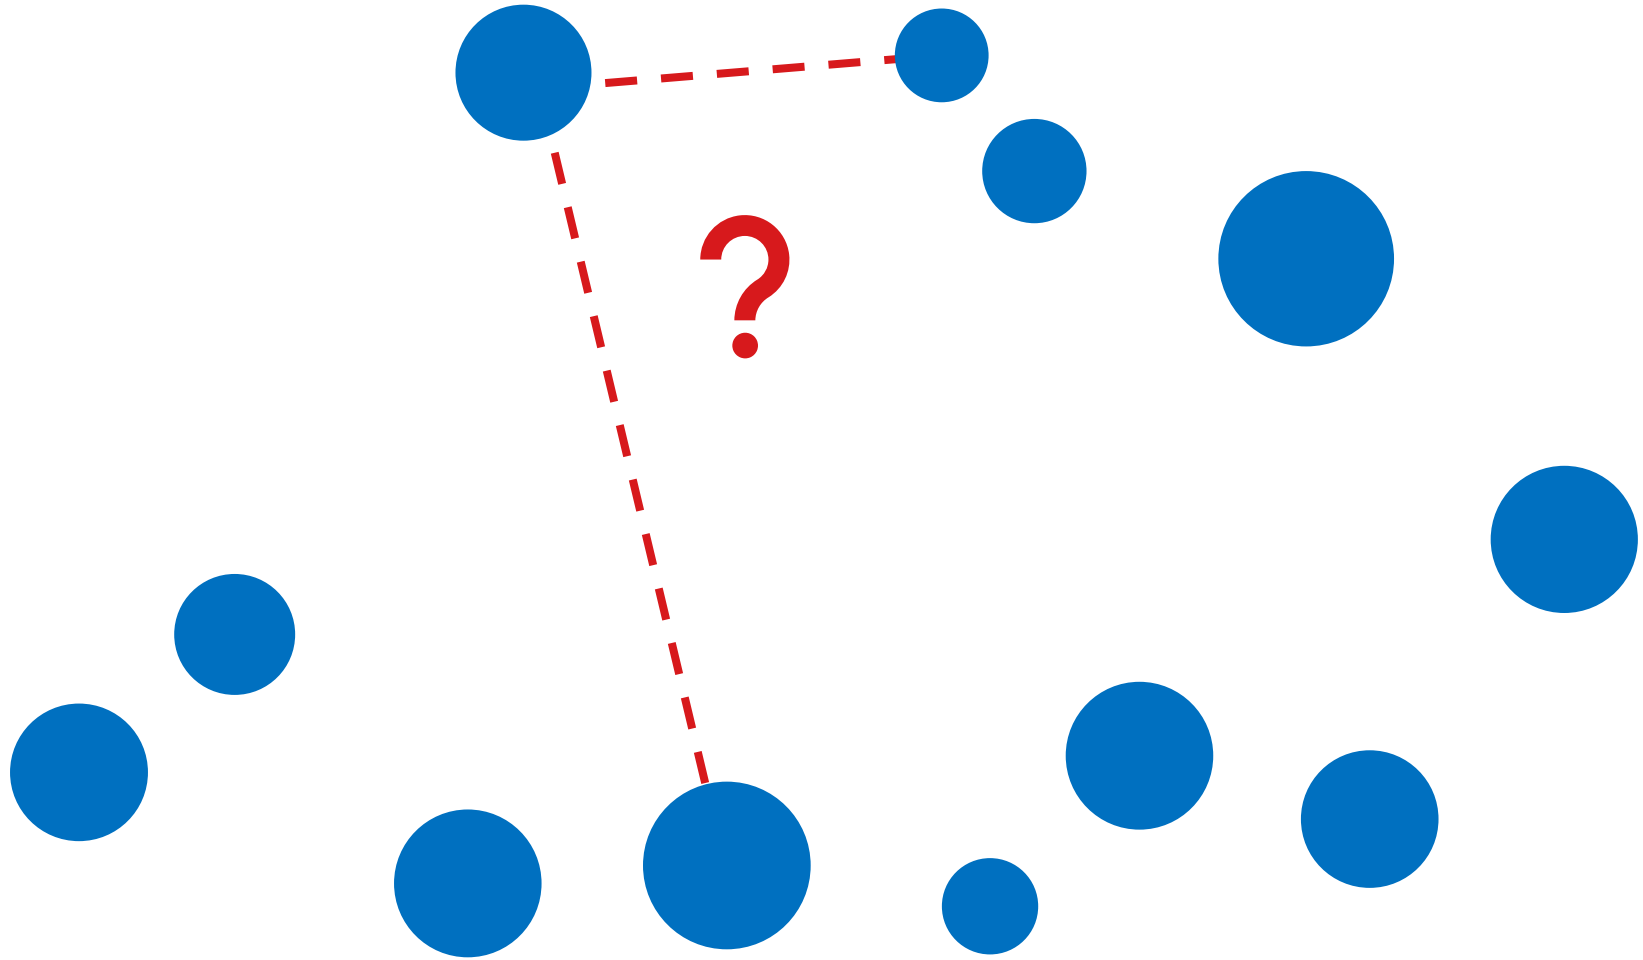
1. Identifying nodes

Spatial networks

2. Connecting nodes

- Nearest neighbours
- Minimum spanning tree
- Connected graph
- …

- Threshold distance
- Dispersal probabilities
- Least-cost paths
- …



Spatial networks

LANDSCAPE CONNECTIVITY: A GRAPH-THEORETIC PERSPECTIVE

DEAN URBAN[1,3] AND TIMOTHY KEITT[2,4]

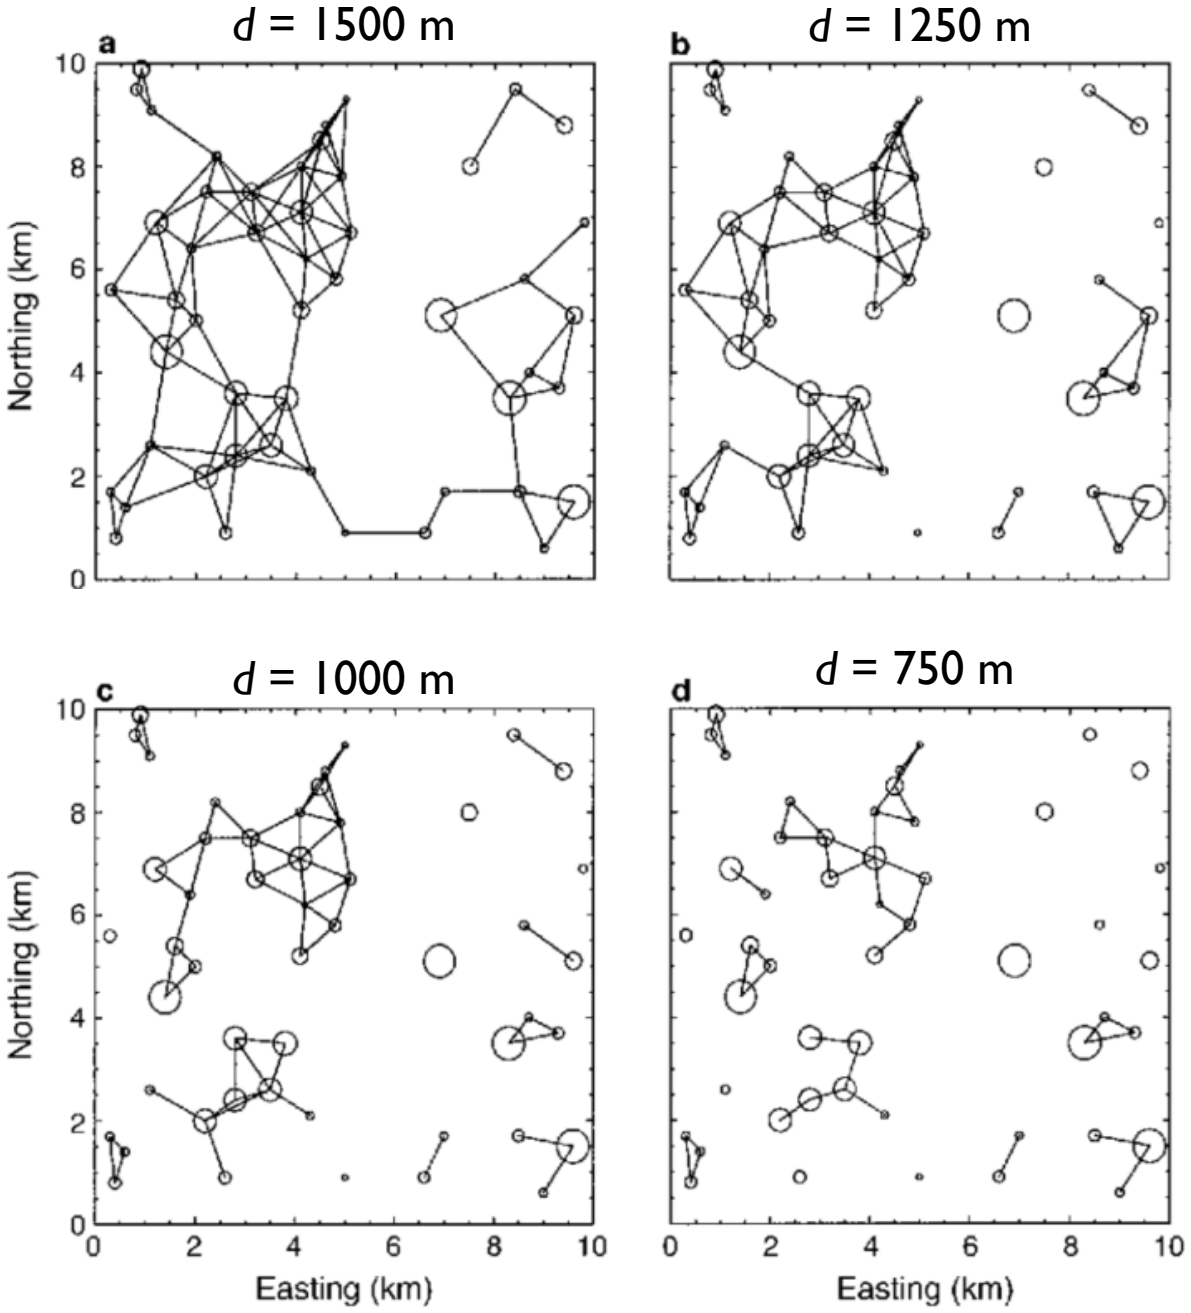
link removal

Is there a relationship between the connectivity of a graph and the number of links removed?

How should corridors be preserved to maintain overall connectivity of the habitat mosaic?

At what threshold distance (*d*) does the graph become unconnected?

How does this distance compare to dispersal capabilities of species of concern?



Ecology, 82(5), 2001, pp. 1205–1218

LANDSCAPE CONNECTIVITY: A GRAPH-THEORETIC PERSPECTIVE

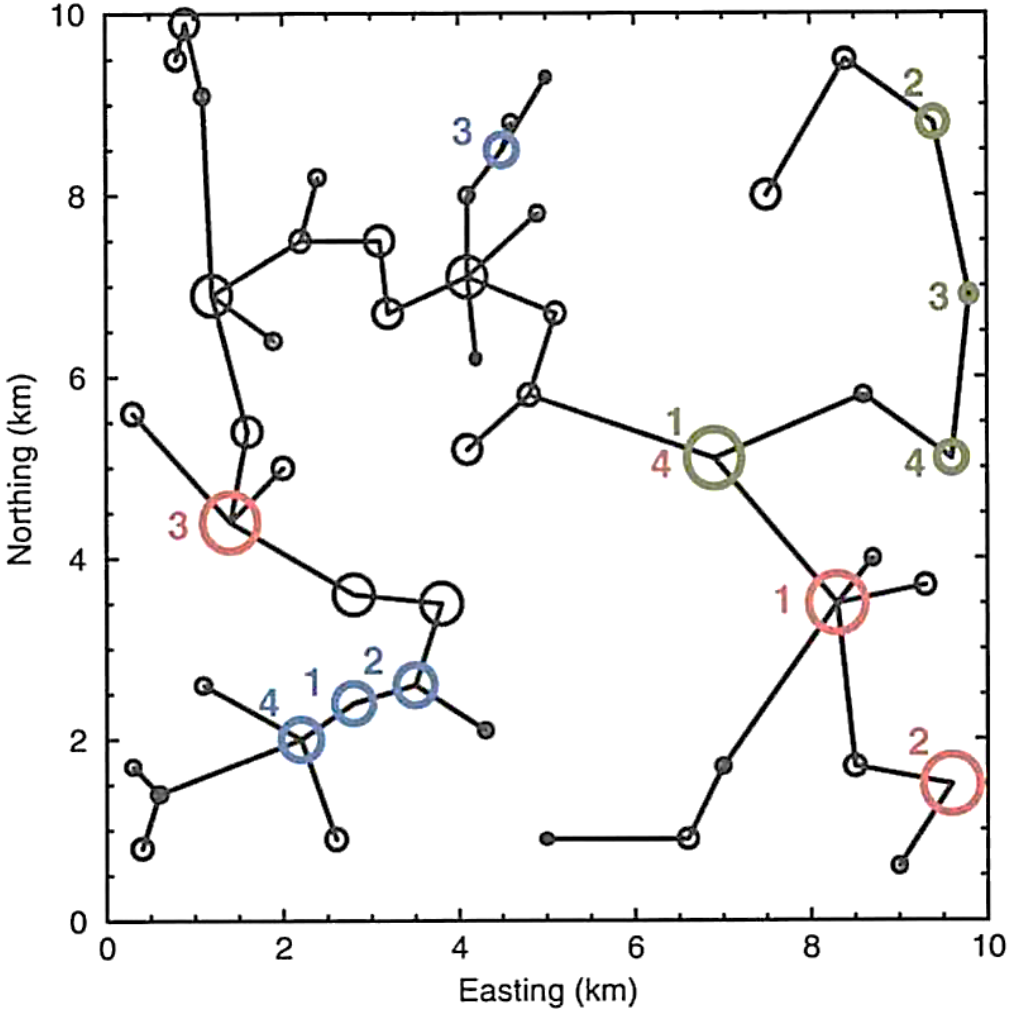
DEAN URBAN[1,3] AND TIMOTHY KEITT[2,4]

node removal

Which nodes are most important for preserving the graph's structure?

Which habitat patches have most influence on metapopulation processes within the landscape?

Which patches should be prioritised for monitoring / protection / restoration?



4 most important patches for:

recruitment potential

dispersal flux

traversability
